OPEN SOURCE CONTRIBUTIONS

- Developer on the coco-caption project which implements commonly used image captioning metrics such as CIDEr, METEOR, BLEU, and ROUGE-L.
- Developer of the CIDEr project which implements the two versions of CIDEr (CIDEr and CIDEr-D) from our CVPR'15 paper on Consensus Based Image Description Evaluation.

SELECTED PROJECTS

- **Class Discriminative Explanations** *Google Research*
 Advisor: Gal Chechik and Samy Bengio Summer and Fall, 2016
 Formulated the task of explaining why the image contains a particular category as opposed to a distractor category using natural language. Formulated a model that at inference time induces class discrimination by trading off explanation and discrimination. Quantitative studies using ranking revealed the generated descriptions are more class discriminative as opposed to a generative baseline.
- **Learning Common Sense** *Virginia Tech*
 Advisor: Devi Parikh and C. Lawrence Zitnick Spring 2015
 Proposed a model to classify common sense tuples such as <man> *looks at* <cake> based on how plausible they are. Showed that better performance can be achieved on tuple classification by combining textual and visual cues. This work is accepted to the IEEE International Conference on computer Vision (ICCV), 2015

- Evaluation of Image Descriptions** *Virginia Tech*
Fall 2014
 Advisor: Devi Parikh and C. Lawrence Zitnick
 Worked on evaluation of image description methods. Proposed a novel evaluation protocol, named CIDEr (Consensus-based Image Description Evaluation) that utilizes human consensus. Showed that our protocol attains better agreement with humans than existing choices. This work is accepted to the IEEE Conference on Computer Vision and Pattern Recognition (CVPR), 2015
- Loopy Part Models for Face Detection** *INRIA-Saclay*
Summer 2014
 Advisor: Iasonas Kokkinos and Dhruv Batra
 Augmented the Deformable Parts Model (DPM) based face detector and landmark estimator with loopy part models. Utilized dual decomposition and an augmented lagrangian technique called ADMM (Alternating Direction Method of Multipliers) to solve the resulting inference problem efficiently, often achieving zero primal dual gap. Applied the model to get results comparable to the state of the art for detection and landmark localization
- Adopting Abstract Scenes for Semantic Scene Understanding** *Virginia Tech*
Spring 2014
 Advisor: Devi Parikh and C. Lawrence Zitnick
 Studied image memorability and object level saliency for abstract scenes made of clipart. Conducted experiments on Amazon Mechanical Turk using a game-like interface to collect image memorability and object-saliency annotations. Correlated these properties to semantic importance of objects, mined using text. This work has been accepted to the IEEE Transactions on Pattern Analysis and Machine Intelligence (TPAMI), 2015
- Understanding and Predicting Importance** *Virginia Tech*
Spring 2014
 Advisor: Devi Parikh
 Formulated importance prediction in abstract images as a structured prediction problem, where importance is defined as the likelihood of an object in an image being mentioned in a description. Incorporated task related insights into feature and model (structure) selection. Predicted importance of objects at upto 86 % accuracy on the Abstract-50S dataset
- CanSat 2011** *IIIT Hyderabad*
Summer 2010
 Advisor: K.S. Rajan
 Designed, fabricated and launched into the lower space an autonomous micro-satellite carrying a large raw hen's egg intact - from *launch* to *landing*. Ground station set up to monitor the mini-satellite. Involved in CanSat testing, circuitry and sensor integration teams
